

## ABSTRACT

The present invention has its object to provide a polyester resin composition which can give molded articles which even upon exposure to elevated temperatures, will not lose their surface gloss and will show little warping and are high in elastic modulus and thermal stability. Molding a polyester resin composition which comprises a polyalkylene terephthalate resin having an acid value of not higher than 30  $\mu\text{eq/g}$  and a layered compound can make it possible to obtain the molded articles having the above-mentioned properties.
